

The Multiplex Concept

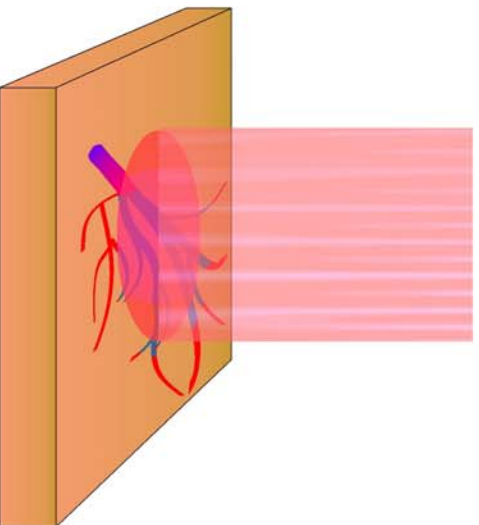

Telangiectasia

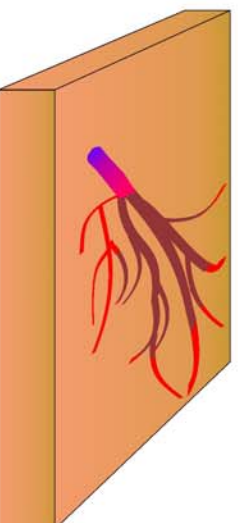

PDL exposure at or below
Purpura threshold dose...

Causes conversion of Hemoglobin to
Meth-Hemoglobin in ~10 msec
(~5-7x greater absorption at 1064-nm than
oxy-hemoglobin),
with or without clot formation

Following a precisely timed delay, typically
50-250-msec, a relatively low Nd:YAG dose
is delivered...

Resulting in either complete intra-vascular coagulation or complete
elimination of vessel
